User manual

Install applications

To install an application, you first need to find the application you wish to install within the store. You can use the categories shown within the store or the search functionality to find the application you want to install.

Once you have found the application you want to install, press the "Install" button. This will begin the process of downloading the application. Since this process can take some time, a notification will be displayed when the application has downloaded. Pressing this notification will begin the installation process where you can review the permissions the application before you choose to install it.

Creating reviews

To create a review for application, you first need to find the application you wish to review within the store. Once you have found the application, scroll to the bottom of the screen where you will find a button label "Create review". When this button is pressed you will be presented with a dialog where you can specify the star rating you want to give an application and the message you want to provide the developer. Since posting your review can take some time, a notification will be displayed when you review has been posted.

Check for application updates

To check for updates, open the menu shown on the "apps" screen of the store. The store will check whether any applications need to updated and list those that do. You can update each application by pressing the "Update" button.

Managing the TOR proxy

To provide users with increased privacy, the store sends its network traffic over the TOR network. In order to do this, the store needs to start a piece of software known as the TOR proxy. This piece of software allows data to be sent and received using the TOR network. The store also allows applications you install on your device to make use of its TOR proxy so they too can increase the privacy of their network connections which may contain your data.

Having the TOR proxy run when it is not in use may cause battery drain and use unnecessary network data so a notification is displayed on users devices when the TOR proxy is running. This notification can be used to stop the TOR proxy, if you feels it has been running too long or is no longer required. Stopping the TOR proxy can cause some applications to stop working but most should be built to restart the TOR proxy if it required.
